

MANUFACTURING SPECIFICATION

1.0 COOLANTS, LUBRICANTS, AND SOLVENTS (CLS)

The Coolants, Lubricants, and Solvents (CLS) used in fabricating parts for microwave, power-grid, and X-ray Vacuum Electron Devices (VEDs) must be controlled to prevent contamination in high-vacuum applications. Chemical constituents that are listed in Section 1.1 must be completely removed during the standard cleaning process at MPP.

All dilution of the commercial materials must be with water or with a sulfur-free, chloride-free, or silicone-free blending oil or solvent.

All parts must be cleaned prior to shipment to MPP to remove any coolants, lubricants, or solvents used during manufacture of the part being supplied. (The exception to this rule would be components made from materials that would rust if not protected by an approved rust inhibitor. Materials in this category should be degreased and coated with an approved rust inhibitor before being packaged for shipment or introduced into the supplier's stock.)

1.1 Parameters of Acceptability

The chemical elements listed below must be completely removed during the standard cleaning process. The MPP standard cleaning process consists of hot alkaline detergent and/or naphtha-based solvents. The CLS compound shall not harden, corrode, or deteriorate the parts under prolonged storage conditions. The chemical elements that are most harmful when present on component parts used in the manufacture of microwave, power-grid, and X-ray VEDs are listed below.

Fluoride	Antimony	Cadmium
Chloride	Lead	Lithium
Sulfur	Mercury	Phosphorus
Manganese	Selenium	Silicon
Potassium	Tellurium	Zinc
Sodium		

1.2 Applicability

Parts that are not used inside the vacuum envelope of microwave, power-grid, and X-ray VEDs or similar devices are exempt from the requirements of Section 1.1. These parts are either made from brass, aluminum, zinc, lead, or plastic or are designated by the drawing as not used in the vacuum envelope of the VED.

1.3 Approved Coolants, Lubricants, and Solvents

A tabulation of the approved coolants, lubricants, and solvents and their designated distributors can be found in Appendix A.

Appendix B lists UNALLOWABLE coolants, lubricants, and solvents that, after evaluation, have NOT demonstrated the ability to satisfy the requirements defined in Section 1.1.

Revision Information

Update company name and logo.

NOTE

UNDER NO CIRCUMSTANCES MAY THE PRODUCTS FROM APPENDIX B BE USED IN THE FABRICATION OF VACUUM-ENVELOPE PARTS. VIOLATIONS SHALL RESULT IN REMOVAL FROM THE APPROVED SUPPLIER LIST AND POSSIBLE EXPOSURE TO CONSEQUENTIAL DAMAGES.

Use of coolants, lubricants, or solvents other than those listed in Appendix A requires suitable proof of conformance to Section 1.1. If a supplier or other MPP division wishes to utilize CLS that are not currently listed on the approved list, they must comply with the provisions of Section 1.4 of this specification. Once approved or disapproved, the CLS will be added to the appropriate current list to prevent redundant evaluation.

The current labeling requirements for ozone-depleting chemicals outlined in M7-13, "Fabrication Standards," must be observed for all applicable CLS. If new alternative materials are to be used, MPP must be notified and the materials must be qualified according to the provision of Section 1.4 of this specification before the substitution can be made.

Products that do not normally come into contact with fabricated parts (specifically, way oils and greases) are not governed by this specification. However, controls must be in place to prevent contamination of parts by incidental contact with these products.

1.4 Qualification of Coolants, Lubricants, and Solvents

Suppliers or other MPP divisions that wish to qualify additional coolants, lubricants, and solvents shall fabricate sample test pieces in conformance with Figure 1. The sample should be created out of the material used in production (OFE Cu, SST, Core Iron, Molybdenum, etc...), and a minimum of 3 sample test pieces **FOR EACH** unique material or part is required. Samples of the corresponding piece part or part number using the coolant, lubricant, or solvent may be used for additional insight or as a substitute in the qualification process, if Figure 1 test pieces are unavailable.

The samples shall be forwarded to the MPP Process Engineer for testing per M18-266, "Coolants, Lubricants, and Solvents Qualification Testing." After testing per M18-266, the samples may fall under three different categories:

1. Approved Coolants, Lubricants, and Solvents – These are Figure 1 test pieces that pass all the test per M18-266. If the sample parts pass the tests, the CLS shall be added to Appendix A.
2. Conditionally Approved Coolants, Lubricants, and Solvents – These are samples that were created using the corresponding piece part, material, or part number using the coolant, lubricant, or solvent. These coolants, lubricants, or solvents **MAY ONLY** be used to create the corresponding piece part, part number, or material. If the sample parts pass the test per M18-266, the CLS shall be added to Appendix A.
3. Unallowable Coolants, Lubricants, and Solvents - These are samples that fail ANY of the test per M18-266. All failed tests must be reviewed by the process engineer first to deem if the coolant, lubricant, or solvent was the factor. If the sample parts fail the tests after review, the CLS shall be added to Appendix B.
